Cookie Data Analysis

Introduction : In our cookie data set cookies—specifically six types: Chocolate Chip, Fortune Cookie, Sugar, oatmeal Raisin, Snickerdoodle, and White chocolate macadamia Nut.

We've got a treasure trove of data on these cookies, covering how many units were sold, their costs, the money they brought in (revenue), and the profits they made. And we're not just looking at one place or time; we're exploring different countries and dates to see how things vary.

This report isn't just about cookies; it's about understanding what people like, how much they're willing to pay, and where these treats are most popular. So, get ready to uncover some fascinating insights into the cookie world and what it means for businesses like yours.

Questionnaire:

- 1 . Compare Malaysia and Philippines on the bases of two types of Cookies
2. What is the performance of Choco Chips Cookies in all Country Which Competes the best.
3. Compare all the countries on the bases of profit and unit sold, which is the best performance country on the basis of profit.
4. which Cookie is the best Selling Cookie in India and US in year 2019,

Analytics:

- 1 . Compare Malaysia and Philippines on the bases of two types of Cookies.

Ans:-It is observed that in Malaysia Chocolate chip is consumed more and on the other hand in Philippines White chocolate is sold more.

2. What is the performance of Choco Chips Cookies in all Country Which Competes the best.

Ans:- India stands out as the foremost consumer of Choco chips worldwide, primarily due to its exceptional profitability and record-breaking sales figures. The market in India has witnessed exponential growth, driven by factors such as a burgeoning population with a growing disposable income, increasing urbanization, and a burgeoning middle class with a penchant for indulgent treats. The combination of these factors has created a highly lucrative environment for Choco chip manufacturers and retailers, leading to significant profits and unparalleled sales volumes in the Indian Market

3. Compare all the countries on the bases of profit and unit sold, which is the best performance country on the basis of profit.

Ans:- India stands out as the leading performer globally when it comes to both profit generation and units sold in the Choco chip market.

4 .which Cookie is the best Selling Cookie in India and US in year 2019,

Ans:- In the year 2019, chocolate chip cookies emerged as the top-selling cookie in both India and the United States.

Conclusion and Review :

After thorough analysis of the cookie sales data, it is evident that there are notable trends and insights to be gleaned. By examining key metrics such as units sold, revenue, cost, and profit across different countries and products, we can draw valuable conclusions about market demand, pricing strategies, and overall profitability. This comprehensive understanding will enable informed decision-making to optimize resources, target specific markets, and maximize profits in future cookie sales endeavours.

Regression:

The regression model, with a significant p-value ($p < 0.001$), indicates a strong positive relationship between units sold and the outcome variable. The model's predictive accuracy is supported by its high R-squared value of 0.688, suggesting that approximately 68.8% of the variability in the outcome variable can be explained by the predictor variable, units sold.

SUMMARY OUTPUT

Regression Statistics	
Multiple R	0.829304
R Square	0.687746
Adjusted R Square	0.687298
Standard Error	1462.76
Observations	700

ANOVA

	df	SS	MS	F	Significance F
Regression	1	3.29E+09	3.29E+09	1537.356	1.4E-178
Residual	698	1.49E+09	2139668		
Total	699	4.78E+09

Correlation:

The correlation coefficient between units sold and revenue is 0.796, indicating a strong positive correlation between the two variables.

	<i>Units Sold</i>	<i>Revenue</i>
Units		
Sold	1	<u>0.796298</u>
Revenue	0.796298	1

Anova (Single Factor) :

The ANOVA results indicate a significant difference between the two groups ($p < 0.001$), with 1 degree of freedom. The within-group error is 7681356717, and the total R-squared value is 0.06, suggesting that the model explains 6% of the variability in the data.

SUMMARY

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>
3450	699	1923505	2751.795	4154648
5175	699	2758189	3945.908	6850161

ANOVA

<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	4.98E+08	1	4.98E+08	90.57022	21	7.53E-
Within Groups	7.68E+09	1396	5502405			3.848129
Total	8.18E+09	1397				

Anova two factor without Replication:

The ANOVA results reveal significant variation among rows and columns ($p < 0.001$), with degrees of freedom (df) values of 48 and 3, respectively. The error term has a degree of freedom of 144.

ANOVA						
<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Rows	8.21E+08	48	17108242	5.848894	17 8.54E-	1.445925
Columns	5.65E+10	3	1.88E+10	6435.486	153 3.8E-	2.667443
Error	4.21E+08	144	2925039			
Total	5.77E+10	195				

Anova two factor with Replication:

The ANOVA results show that there is a significant difference among the samples, columns, and their interaction, with p-values less than 0.001. The degrees of freedom for the samples, columns, and interaction are 49, 3, and 147, respectively.

Furthermore, the total error within the model is 0, indicating a perfect fit. The total R-squared value is 1, suggesting that the model explains all the variability in the data.

Supermarket Sales

Introduction:

Dataset Overview:

Our dataset comprises a plethora of variables, each offering unique insights into the multifaceted nature of supermarket sales. From fundamental transactional details such as Invoice ID, Date, Time, and Payment Method to more nuanced factors like Branch Location, Customer Type, Gender Demographics, Product Line, and Product Ratings, every facet has been meticulously documented.

Key Attributes:

1. Invoice ID: A unique identifier for each sales transaction, facilitating traceability and analysis.
2. Branch (A, B, C): The geographical location of the supermarket branch, allowing for regional comparisons and trend identification.
3. Customer Type (Normal, Member): Distinguishing between regular customers and members, offering insight into loyalty and engagement levels.
4. Gender (Male, Female): Demographic segmentation aiding in understanding purchasing preferences and patterns.
5. Product Line (Fashion Accessories, Electronic Accessories, Food and Beverages, Health and Beauty, Home and Lifestyle, Sports and Travel): Categorization of products facilitating analysis of sales trends across different product categories.
6. Unit Price, Quantity, Tax (5%): Fundamental transactional details crucial for revenue assessment and pricing strategies.
7. Payment Method (Credit Card, Cash, E-wallet): Reflecting evolving payment preferences and trends in consumer behavior.
8. Gross Margin Percentage, Gross Income, COGS: Performance metrics illuminating profitability and operational efficiency.
9. Rating (1 to 10): Customer feedback providing a qualitative assessment of product satisfaction and service quality.
10. City (Yangon, Mandalay, Naypyitaw): Regional segmentation enabling geographical analysis and market segmentation.

Questionnaire:

- Q1. Which of the given cities having tax 5% slab performed better than all the others?
- Q2. Which customer gender ordered most items from all the three branches?
- Q3. Compare highest and lowest rating products on the basis of units sold.
- Q4. Analyzing units sold and unit price data answer the following sub questions
- a) What is the degree of freedom?
 - b) Co-relation of Unit price and revenue generated
 - c) What result you can draw from regression of the two data
- Q5. What product will you suggest as per the city data analysis to each type of customer

Q1. Which of the given cities having tax 5% slab performed better than all the others?

Total	Tax 5%	City
10.6785	0.5085	Mandalay
12.6945	0.6045	Naypyitaw
13.167	0.627	
13.419	0.639	
14.679	0.699	
16.107	0.767	
16.2015	0.7715	
16.275	0.775	

Based on the data analyzed, the city that outperformed all is **Mandalay**. This conclusion is drawn from superior performance in total sales/revenue generation compared to the other cities in the same tax slab of 5%.

Q2. Which customer gender ordered most items from all the three branches?

Quantity	Gender	Branch
1	Female	A
2	Male	B
3		C
4		
5		
6		
7		
8		

Ans: It is observed that Female customers in total ordered more than men , but if we see every branch solo in only branch A female customers ordered less than men.

Q3. Compare highest and lowest rating products on the basis of units sold.

Rating	Quantity	Product line
4	1	Electronic accessories
4.1	3	Fashion accessories
4.2	4	Food and beverages
4.3	6	Health and beauty
4.4	7	Sports and travel
4.5	8	
4.6	9	
4.7	10	Home and lifestyle

Ans: The least popular product are Fashion accessories and highest selling product are Food and Beverages.

Q4. Analyzing units sold and unit price data answer the following sub questions

- What is the degree of freedom?
- Co-relation of Unit price and revenue generated
- What result you can draw from regression of the two data

SUMMARY OUTPUT						
<i>Regression Statistics</i>						
Multiple R	0.010777564					
R Square	0.000116156					
Adjusted R Square	-0.000885732					
Standard Error	2.924724997					
Observations	1000					
<i>ANOVA</i>						
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>	
Regression	1	0.9917274	0.991727	0.115937	0.733555221	
Residual	998	8536.908273	8.554016			
Total	999	8537.9				
	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>
Intercept	5.443794599	0.215314544	25.28299	2.1E-109	5.021273429	5.86631577
Unit price	0.001189202	0.003492565	0.340495	0.733555	-0.005664411	0.008042815

Solution:

- The degree of freedom of the analyzed data is 1.
- The Co-relation of Unit Price and Revenue generated turned out to be 0.63392. The two columns considered in the calculation were Unit Price and the Total. Function Used: =CORREL
- From the regression result we can plot the following graph:

Q5. What product will you suggest as per the city data analysis to each type of customer

Rating	Customer type	Product line
4	Member	Electronic accessories
4.1	Normal	Fashion accessories
4.2		Food and beverages
4.3		Health and beauty
4.4		Home and lifestyle
4.5		
4.6		
4.7		Sports and travel

Ans: Most of the Members spend more on Food and Beverages while on the other hand Normal person spend on Fashion Accessories.

Conclusion and Review:

The comprehensive analysis of supermarket sales dynamics provides valuable insights into consumer behavior, operational trends, and performance metrics. Here's a summary of the findings and reviews:

1. City Performance:

Mandalay emerged as the top-performing city among those with a 5% tax slab. Its superior sales/revenue generation signifies a potentially lucrative market for supermarket businesses.

2. Gender-based Ordering:

Female customers showed a higher propensity to order items from Branch A, while males dominated in Branch C. Branch B saw equal orders from both genders. This gender-specific trend highlights the importance of targeted marketing strategies.

3. Rating and Units Sold:

Further analysis is needed to compare products with the highest and lowest ratings based on units sold. Understanding the correlation between product ratings and sales volume can inform inventory management and marketing decisions.

4. Unit Price and Revenue Relationship:

The regression analysis revealed a weak correlation ($R^2 = 0.0001$) between unit price and quantity sold. This suggests that customers' purchasing decisions may not be significantly influenced by unit price alone, indicating the need for deeper insights into consumer preferences and behavior.

5. Product Recommendations:

Based on city data analysis, Food and Beverages are recommended for member-type customers, while Fashion Accessories are suggested for normal customers. These recommendations align with the observed preferences and purchasing patterns in respective cities.

Reviews:

The report provides a thorough exploration of supermarket sales dynamics, covering various aspects such as city performance, gender-based ordering trends, and product recommendations.

The inclusion of regression analysis enhances the depth of insights, though further interpretation of the results could strengthen the analytical rigor.

Clear visuals, such as graphs and charts, would enhance the presentation of findings and aid in understanding complex relationships.

Overall, the report offers valuable insights for supermarket stakeholders, highlighting areas for strategic focus and improvement in marketing and operational strategies.

Store Dataset Report

Introduction: This dataset encompasses sales data from a retail store, featuring a range of attributes including customer demographics (Gender, Age Group), transaction details (Order ID, Status), product specifics (Category, SKU), and shipping information. With a focus on understanding customer behaviour and product trends, our analysis aims to uncover patterns, preferences, and correlations within the data. By leveraging these insights, businesses can optimize marketing efforts, enhance inventory management, and improve customer satisfaction.

Questionnaire:

1. which of the channel performed better than all other channels in compare men &women?
2. Compare category. Find out most sold category above 23 years of age for any gender.
3. Compare Maharashtra, Rajasthan and Tamil Nadu on the basis of quantity, most items purchased by men and women and profit earn.
4. Which city sold most of following categories:
 - a. Kurta
 - b. Set
 - c. Western wears
5. In which month most items sold in any of the state on the basis of category.

Analytics:

1. which of the channel performed better than all other channels in compare men &women?

Ans: Amazon leads in the sales in both men and women category followed by Myntra and Flipkart. Amazon sold almost 3500 units in men category and almost 7500 units in women category. Myntra sold 2000 units in men section.

2. Compare category. Find out most sold category above 23 years of age for any gender.

The table of items sold is given below:

Item	Men	Women	Grand Total
Blouse	6	190	196
Bottom	40	28	68
Ethnic Dress	150	77	227
kurta	156	8820	8976
Saree	261	941	1202
Set	4365	6204	10569
Top	45	1825	1870
Western Dress	3078	380	3458
Grand Total	8101	18465	26566

The graph is as follows:

Ans: In the above 23 years of age group Kurta is most sold category in women section with 8820 units sold. Set is most sold category in men section with 4365 units sold also set is the second most sold category in women section.

3. Compare Maharashtra, Rajasthan and Tamil Nadu on the basis of quantity, most items purchased by men and women and profit earn.

Ans: In Maharashtra: Sales in men category=1390, Sales in women category= 3144

In Tamil Nadu: Sales in men category=686, Sales in women category= 2023
In Rajasthan: Sales in men category=21, Sales in women category=543

4. Which city sold most of following categories

- Kurta Set
- Western wears

Ans: Bengaluru, Chennai, Hyderabad, Mumbai and New Delhi are the cities sold most of kurtas, Sets and western wears.

5. In which month most items sold in any of the state on the basis of category.

Ans: The graph shows that March is the Month in which most items were sold.

Conclusion and Review:

After thorough analysis of the store data, it is evident that there are notable trends and insights to be gleaned. By examining key metrics such as units sold, state wise analytics, geographic, and sales across different stats and products, we can draw valuable conclusions about market demand, sales and overall profitability. This comprehensive understanding will enable informed decision-making to optimize resources, target specific markets, and maximize profits in future store sales endeavours.

Exploring Car Dataset

Introduction:

Dataset Overview:

This dataset comprises a blend of categorical and numerical data, each offering unique perspectives on the industry. Categorical data, such as make, model, and color, encapsulates the diversity of vehicles and consumer preferences. Meanwhile, numerical attributes like mileage, price, and cost provide quantifiable metrics essential for analyzing market trends and pricing dynamics.

Key Attributes

1. Make: This attribute denotes the brand or manufacturer of the vehicle, offering insights into brand preferences and market share.
2. Model: The specific model of the car, providing granularity in understanding consumer choices and preferences within each brand.
3. Color: Reflects the color of the vehicle, which can influence consumer perception and aesthetic preferences.
4. Mileage: Indicates the distance traveled by the vehicle, a crucial factor influencing its value and pricing.
5. Price: Represents the listed price of the vehicle, serving as a key determinant in consumer purchasing decisions and market competitiveness.
6. Cost: Denotes the cost associated with acquiring the vehicle, which includes factors such as production costs, dealer margins, and other expenses.

Questionnaire

- Q1. Compare the mileage of Chevrolet Impala to Toyota Corolla. Which of the two is giving best mileage?
- Q2. Justify, Buying of any Ford car is better than Honda
- Q3. Among all the cars which car color is the most popular and is least popular?
- Q4. Compare all the cars which are of silver color to the green color in terms of Mileage.
- Q5. Find out all the cars, and their total cost which is more than \$2000?

Analytics:

Q1. Compare the mileage of Chevrolet Impala to Toyota Corolla. Which of the two is giving best mileage?

Ans. Toyota Corolla gives better mileage than Chevrolet Impala

Q2. Justify, Buying of any Ford car is better than Honda.

Mileage
40826
41560
42542
49326
63259
63512
89073
95135

Price
2000
2500
2659
2723
3196
3706
3950
4000

Cost
1500
1900
2000
2100
3000
3050
3100
3900

Ans. Based on the averages, Honda cars have higher mileage but lower cost compared to Ford. Therefore, the choice depends on whether the buyer values mileage or cost but if we compare on mileage ford car has low mileage and cost so Buying ford car is better then Honda.

Q3. Among all the cars which car color is the most popular and is least popular?

Ans. Most popular color is Silver and Black as each appear 6 times
and least appearing colour are Blue ,Green ,Red ,White they all appear 3 times.

Q4. Compare all the cars which are of silver color to the green color in terms of Mileage.

Mileage	Filter
34853	
41560	
55233	
58173	
59169	
69847	
87675	
101354	

Color	Filter
Black	
Blue	
Green	
Red	
Silver	
White	
(blank)	

Ans. Silver color car millage is more than green color car milage if we compare there average.

Q5. Find out all the cars, and their total cost which is more than \$2000?

Ans. All the car mention below cost is more than \$2000:

Accord, Altima, Charger, Corolla, CRV, Escape, F-150, Fusion, Impala, Malibu, Maxima, Mustang, Silverado

Model	Cost
Accord	\$1,500
Altima	\$1,800
Camry	\$1,900
Charger	\$2,000
Civic	\$2,100
Corolla	\$2,200
CRV	\$2,500
Escape	\$3,000

Regression

The regression analysis suggests a moderate positive relationship between the predictor variable and the response variable, indicated by the correlation coefficient of approximately 0.40. The model explains about 16% of the variance in the response variable, as indicated by the R Square value. The coefficient estimates show that for every unit increase in the predictor variable, there is a corresponding decrease of approximately 16.66 in the response variable, with a p-value of 0.056, indicating a marginally significant effect.

SUMMARY OUTPUT						
Regression Statistics						
Multiple R	0.40404555					
R Square	0.1632528					
Adjusted R Square	0.1234077					
Standard Error	33099.5397

Regression	1	4488793099	4488793099	4.09718598	0.05586127	
Residual	21	2.3007E+10	1095579531			
Total	22	2.7496E+10				
Coefficients						
	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	130438.919	23634.1932	5.51907645	1.7789E-05	81288.9236	179588.914
3000	-16.664135	8.23265547	-2.0241507	0.05586127	-33.784879	0.45660911
					81288.9236	179588.914
					-33.784879	0.45660911

Co-relational

The correlation matrix indicates a moderate negative correlation (-0.411) between Mileage and Price. This suggests that as Mileage increases, Price tends to decrease, and vice versa.

	Mileage	Price
Mileage	1	
Price	-0.4110586	1

Anova: Single Factor

The ANOVA results indicate significant differences between the groups based on Mileage, Price, and Cost. The F-statistic is large (128.88), with a very low p-value (5.00264E-24), suggesting that the variation between groups is significant compared to the variation within groups. This implies that at least one of the variables (Mileage, Price, or Cost) has a significant effect on the outcome being measured. In simpler terms, there are statistically significant differences in the means of Mileage, Price, and Cost across the groups, indicating that these variables play a significant role in influencing the outcome being analyzed.

SUMMARY

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>
				121415566
Mileage	24	2011267	83802.7917	0
Price	24	78108	3254.5	837024.087
Cost	24	66150	2756.25	705502.717

ANOVA

<i>Source of Variation</i>	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>P-value</i>	<i>F crit</i>
Between Groups	1.0445E+1	2	5.2227E+1	0	128.882161	5.0026E-24
Within Groups	2.7961E+1	69	405232729			3.12964398
Total	1.3242E+1	71				

Anova: Two-Factor Without replication

The two-factor ANOVA results indicate significant differences among the levels or categories within each factor ("Rows" and "Columns"). Both factors exhibit strong influence on the outcome variable being analyzed, as evidenced by the low p-values and large F-statistics. This suggests that variations in both factors contribute significantly to the overall variability in the data.

Descriptive Statistics

The provided descriptive statistics outline the characteristics of three variables: Mileage, Price, and Cost. Looking at Mileage, it appears that the vehicles in the dataset span a considerable range, from around 34,853 miles to 140,811 miles, with an average mileage of approximately 83,803 miles. Price and Cost exhibit similar trends, with prices ranging from \$2,000 to \$4,959 and costs from \$1,500 to \$4,500, respectively. The means and standard deviations provide insights into the central tendencies and variability within each variable. Overall, these statistics offer a comprehensive overview of the dataset, allowing for a better understanding of the distribution and characteristics of the data.

	Mileage	Price		Cost	
Mean	83802.7917	Mean	3254.5	Mean	2756.25
Standard Error	7112.65205	Standard Error	186.751181	Standard Error	171.452462

Smallest(1)	34853	Smallest(1)	2000	Smallest(1)	1500

Conclusion/Reviews:

The dataset provides valuable insights into car attributes, focusing on mileage, color, and other key factors.

Here's a simple conclusion based on the data:

Mileage Comparison: The analysis reveals variations in mileage among different car models. Toyota Corolla generally offers better mileage compared to Chevrolet Impala.

Color Preferences: Silver and black emerge as the most popular car colors in the dataset. Blue, green, red, and white are among the least popular color choices.

Key Takeaways: Understanding mileage differences can inform consumer choices and market strategies. Recognizing color preferences aids in inventory management and marketing decisions.

Order Data Analysis

Introduction:

Our dataset comprises a plethora of variables, each offering unique insights into the multifaceted nature of different category sales. From fundamental transactional details such as Date, Time, sales, states to more nuanced factors like Customer Type, Demographics, category and sub category, every facet has been meticulously documented.

Key Attributes:

ID: A unique identifier for each sales transaction, facilitating traceability and analysis.

City, State: The geographical location of the data allowing for regional comparisons and trend identification.

Product Line (furniture, Electronic Accessories, appliances, Home and Lifestyle): Categorization of products facilitating analysis of sales trends across different product categories.

Unit Price, Net sales Fundamental transactional details crucial for revenue assessment and pricing strategies.

Net sales of different category, category performing well in different states: Performance metrics

Rating: different product performing well in different state

States (California, Texas and Washington): Regional segmentation enabling geographical analysis and market segmentation.

Questionnaire:

1. Compare all the US states in terms of Segment and Sales. Which Segment performed well in all the states?
2. Find out top performing category in all the states?
3. Which segment has most sales in US, California, Texas, and Washington?
4. Compare total and average sales for all different segment?
5. Compare average sales of different category and sub category of all the states.

Analytics:

Q1. Compare all the US states in terms of Segment and Sales. Which Segment performed well in all the states?

Ans: After comparing all the states in terms of segment and sales, California emerged as the state with the highest amount of sales Consumer segment performed well in all the states

Slicers:

Q2. Find out top performing category in all the states?

Slicers:

Ans: Office Supplies is the top performing category in all the states

Q3. Which segment has most sales in US, California, Texas, and Washington?

Slicers:

Ans. Consumer segment has the most sales in US, California, Texas, and Washington

Q4. Compare total and average sales for all different segment?

TOTAL VS AVERAGE SALES OF DIFFERENT CATEGORIES

Slicers:

Ans. By Analysis, we can find out that the total sales were a lot higher than the average Sales for each segment.

Q5. Compare average sales of different category and sub category of all the states.

Ans. In Average Sales vs Category we can observe that the category Technology has the maximum sales. And in Average Sales vs Sub-Category we can observe that the category Copiers has the maximum sales.

Q6. Find out state wise mode for Customer and Segment. California, Illinois, New York, Texas, Washington

Ans.

For California: Customer- William Brown, Segment-Consumer

For Illinois: -Customer- William Brown, Segment-Consumer

For New York: Customer- William Brown, Segment-Consumer

For Texas: Customer- William Brown, Segment-Consumer

For Washington: Customer- William Brown, Segment-Consumer

Regression and ANOVA:

SUMMARY OUTPUT								
<i>Regression Statistics</i>								
Multiple R	0.003989285

	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>			
Regression	1	8769.275428	8769.275428	0.031781546	0.85852604			
Residual	1997	551019236.5	275923.5035					
Total	1998	551028005.8						
	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%	Lower 95.0%	Upper 95.0%
Intercept	232.5093842	22.96786412	10.12324799	1.59291E-23	187.4658976	277.5528709	187.4658976	277.5528709
Postal Code	-6.54575E-05	0.000367174	0.178273794	0.85852604	0.000785542	0.000654627	0.000785542	0.000654627

This regression output provides information about the relationship between the predictor variable (Postal Code) and the response variable (which is not explicitly mentioned in the output). Let's break down each section of the output:

Regression Statistics:

- **Multiple R:** This is the correlation coefficient, which measures the strength and direction of the linear relationship between the predictor and response variables. In this case, it's very close to zero (0.00399), indicating a very weak linear relationship.

- **R Square:** This is the coefficient of determination, which represents the proportion of the variance in the response variable that is explained by the predictor variable. A value close to zero (1.59144E-05) indicates that the predictor variable explains very little of the variance in the response variable.

Adjusted R Square: This is a modified version of R Square that adjusts for the number of predictor variables in the model. A negative value (-0.000484829) suggests that the model may be overfitting or that the predictor variable is not adding any explanatory power to the model.

Standard Error: This represents the average deviation of the observed values from the regression line. A higher standard error (525.2842121) indicates greater variability in the data points around the regression line.

Observations: This indicates the number of data points used in the regression analysis.

ANOVA (Analysis of Variance):

df: Degrees of freedom represent the number of independent pieces of information available in the data.

SS: Sum of squares measures the total variation in the response variable.

MS: Mean square is the average variation within groups or between groups.

F: The F-statistic tests the overall significance of the regression model. A low F-value relative to the critical value indicates that the model is not significant.

Significance F: This is the p-value associated with the F-statistic. A high p-value (0.85852604) suggests that the model is not statistically significant.

Coefficients:

Intercept: This is the y-intercept of the regression line, representing the predicted value of the response variable when the predictor variable is zero. The coefficient (232.5093842) indicates the average value of the response variable when the predictor variable is zero.

Postal Code: This is the coefficient for the predictor variable. It represents the change in the response variable for a one-unit change in the predictor variable. The coefficient (-6.54575E-05) suggests a very small negative effect of the Postal Code on the response variable, but it is not statistically significant given the high p-value (0.85852604).

Overall, based on this regression output, the model does not appear to provide a meaningful explanation of the variation in the response variable, and the predictor variable (Postal Code) does not appear to have a significant effect on the response variable.

Correlation:

The absolute value of the correlation coefficient (0.024067424) is close to zero. This suggests a very weak linear relationship between the two variables.

Descriptive Statistics:

Sales

Mean	230.7691
Standard Error	6.33014
Median	54.49

4. CONCLUSION AND REVIEWS:

Conclusion:

In delving into the sales data across various segments in different US states, our analysis has unearthed valuable insights. The dataset provided a comprehensive view, encompassing crucial variables such as geographical location, product categorization, transactional details, and performance metrics. Through meticulous scrutiny, we addressed pertinent questions and gleaned actionable conclusions.

California emerged as a focal point, exhibiting the highest sales volume among the states analyzed. Notably, the consumer segment showcased consistent performance across all states, underscoring its significance in the market landscape.

Across categories, office supplies emerged as the top performer in all states, indicating a universal demand for these products. Furthermore, the consumer segment demonstrated dominance in terms of sales across the US, including California, Texas, and Washington.

Analysis of total versus average sales per segment revealed significant disparities, with total sales outweighing average sales across the board. This highlights the presence of outlier transactions or high-value sales within each segment.

Delving deeper into category and sub-category analysis, technology emerged as the category with the highest average sales, suggesting a strong market demand for technological products. Subsequently, copiers emerged as the top contributor to average sales distribution, emphasizing their importance within the technology category.

Reviews:

1. Thorough Analysis with Actionable Insights: The exploration of sales data across US states provides a comprehensive understanding of market dynamics. The inclusion of key attributes and performance metrics ensures a robust analysis, enabling stakeholders to derive actionable insights for strategic decision-making.
2. Clear Presentation of Findings: The presentation of findings is concise and structured, facilitating easy comprehension of complex data. The use of slicers enhances the visual representation, aiding in the interpretation of results and facilitating informed decision-making.
3. Insightful Conclusions: The conclusion succinctly summarizes key findings and draws meaningful conclusions from the analysis. By highlighting overarching trends and significant observations, it provides valuable guidance for market strategies and future research endeavors.

Overall, the exploration of sales data offers valuable insights into market trends and consumer behavior, serving as a foundation for informed business strategies and market interventions.

Loan Dataset Report:

Introduction:

Dataset Overview:

Our dataset encompasses a diverse range of variables, each shedding light on the intricate dynamics of loan applications. From fundamental applicant details such as Gender, Marital Status, and Education to more nuanced factors like Employment Status, Loan Amount, and Residential Type, every aspect has been meticulously recorded.

Questionnaire:

Q1. How many male graduates who are not married applied for Loan? What was the highest amount?

Q2. How many female graduates who are not married applied for Loan? What was the highest amount?

Q3. How many male non-graduates who are not married applied for Loan? What was the highest amount?

Q4. How many female graduates who are married applied for Loan? What was the highest amount?

Q5. How many male and female who are not married applied for Loan? Compare Urban, Semi-urban and rural on the basis of amount.

Analytics:

Q1. How many male graduates who are not married applied for Loan? What was the highest amount?

Gender
Female
Male
(blank)

Married
No
Yes
(blank)

Education
Graduate
Not Graduate
(blank)

Ans: There are 66 Graduate Unmarried Male who applied for loan and Maximum amount for loan is 240.

Q2. How many female graduates who are not married applied for Loan? What was the highest amount?

Gender	Married	Education
Female	No	Graduate
Male	Yes	Not Graduate
(blank)	(blank)	(blank)

Ans: There are 35 Graduate Unmarried Female who applied for loan and Maximum amount for loan is 300.

Q3. How many male non-graduates who are not married applied for Loan? What was the highest amount?

Ans: There are 16 Ungraduate Unmarried Male who applied for loan and Maximum amount for loan is 199.

Q4. How many female graduates who are married applied for Loan? What was the highest amount?

Gender	Filter
Female	Filter icon

Married	Filter
Yes	Filter icon

Education	Filter
Graduate	Filter icon

Ans: There are 21 Graduate Married Female who applied for loan and Maximum amount for loan is 460.

Q5. How many male and female who are not married applied for Loan? Compare Urban, Semi-urban and rular on the basis of amount.

Ans: Unmarried Male who applied for loan are 82 which is 65% in total and Unmarried female who applied for loan are 44 which are 35% .

In Urban 5167, in Semiurban 5165 and in Rular 4976 loans are taken by people.

Conclusion:

Our analysis, using varied visualization techniques, revealed valuable insights, enhancing comprehension and decision-making. Visualizing data clarified complex findings, facilitating actionable strategies. This highlights the pivotal role of data visualization in extracting meaningful insights and informing decisions effectively.

Regression:

The regression analysis suggests that there is a statistically significant positive relationship between the independent variable ('5720') and the dependent variable. For every one-unit increase in '5720', the dependent variable is expected to increase by approximately 0.0059 units. However, it's important to note that the model only accounts for about 21.1% of the total variance in the dependent variable.

SUMMARY OUTPUT

Correlation :

The data shows weak negative correlation between Applicant-Income and Co-applicant-Income (-0.11), and moderate positive correlation between Applicant-Income and Loan-Amount (0.46), and weaker positive correlation between Co-applicant-Income and Loan-Amount (0.14).

	<i>ApplicantIncome</i>	<i>CoapplicantIncome</i>	<i>LoanAmount</i>
ApplicantIncome	1		
CoapplicantIncome	-0.110334799	1	
LoanAmount	0.458768926	0.144787815	1

Anova (Single Factor) :

The dataset encompasses 367 observations, detailing applicant and co-applicant incomes alongside loan amounts. On average, applicants possess a higher income, averaging around \$4805.60, compared to co-applicants whose average income is approximately \$1569.58. Loan amounts vary widely, averaging \$134.28. ANOVA analysis underscores significant distinctions between the income and loan amounts across the groups, implying diverse financial profiles among applicants and co-applicants.

SUMMARY

<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>
ApplicantIncome	367	176365	4805.59945	24114831.0

Shop Sales Data

Introduction:

This dataset encapsulates a wealth of information regarding sales transactions, providing valuable insights into the dynamics of retail operations. With columns meticulously crafted to capture key facets of each transaction, including Date, Salesman, Item Name, Company, Quantity, and Amount, analysts and businesses alike gain access to a treasure trove of actionable data.

Whether it's uncovering trends, optimizing inventory management, or refining sales strategies, this dataset serves as an invaluable resource for driving informed decision-making and unlocking new avenues for growth.

Questionnaire:

1. Compare all the salesmen on the basis of profit earn.
2. Find out most sold product over the period of May-September.
3. Find out which of the two product sold the most over the year Computer or Laptop?
4. Which item yield most average profit?
5. Find out average sales of all the products and compare them.

Analytic:

1. Compare all the salesmen on the basis of profit earn.

Amount
1000
1200
2300
2507
2618
2730
2841
3000

Salesman
Aman
Rahul
Ram
Rohit
Vinod

Ans: Most profit is earned by Rohit and Rahul and on the other hand least is earned by Aman.

2. Find out most sold product over the period of May-September.

Date	Qty	Item Name
01-05-2019	14	Computer
02-05-2019	14	Laptop
03-05-2019	14	Mobile
04-05-2019	15	
05-05-2019	15	
06-05-2019	15	
07-05-2019	15	
08-05-2019	15	

Ans:- To identify the most sold product over the period of May-September, we would need to analyze the sales data within this timeframe. By aggregating the quantity sold for each product across all transactions during this period and then determining which product has the highest total quantity sold, we can pinpoint the most popular item.

3. Find out which of the two product sold the most over the year Computer or Laptop?

Ans: Laptops are sold 4% more than Computers.

4 . Which item yield most average profit?

Ans:- The item that yields the most profit between laptop, computer and mobile is : Mobile

5. Find out average sales of all the products and compare them.

Ans:- The average sales of all the products with their respective comparison is :

Mobile:7057

Laptop:6773

Computer:6770

Conclusion and Review :

The shop sales dataset offers insights into sales trends, salesman performance, item popularity, and company performance. Analysis of this data can drive strategic decisions and improve sales strategies.

The dataset is well-structured and provides comprehensive information on sales transactions. It allows for various analyses, but could benefit from additional variables for deeper insights. Overall, it's a valuable resource for understanding sales dynamics and informing business decisions.

Regression: The regression model, with a significant p-value indicates a strong positive relationship between Amount and the profit earned and the outcome variable. The model's predictive accuracy is supported by its high R-squared value of 0.660.

Sales Data Samples

Introduction: In the realm of business analytics, a dataset encompassing sales transactions emerges as a vital asset for deriving actionable insights. With columns detailing ORDERNUMBER, QUANTITYORDERED, PRICEEACH, and more, it offers a comprehensive view of sales dynamics. From tracking individual orders to analysing product performance and customer behaviour, this dataset provides a rich source of information essential for strategic decision-making and operational optimization in today's competitive landscape.

Questionaries:

1. Compare the sale of Vintage cars and Classic cars for all the countries.
2. Find out average sales of all the products? which product yield most sale?
3. Which country yields most of the profit for Motorcycles, Trucks and buses?
4. Compare sales of all the items for the years of 2004, 2005.
5. Compare all the countries based on deal size.

Analytics:

1. Compare the sale of Vintage cars and Classic cars for all the countries.

Ans: USA is on the top in sales of both Vintage and Classic Cars.

2. Find out average sales of all the products? which product yield most sale?

Ans:

SALES	PRODUCTLINE
482.13	Classic Cars
541.14	Motorcycles
553.95	Planes
577.6	Ships
651.8	Trains
652.35	Trucks and Buses
683.8	Vintage Cars
694.6	

Ans: Product Trucks and Buses are sold most in the above comparison.

And Average sales of

Vintage cars: 3135

Motorcycles: 3523

Trucks and Buses: 3746

Planes: 3186

Trains: 2938

Ships: 3055

3. Which country yields most of the profit for Motorcycles, Trucks and buses?

Ans: The country Australia yields most of the profit for Motorcycles, Trucks and buses

4. Compare sales of all the items for the years of 2004, 2005.

Ans: - The following is the sales of all the items for the years of 2004, 2005 and as graph represents the sales has grown down from 20024 to 2005.

5. Compare all the countries based on deal size.

DEALSIZE	COUNTRY	PRODUCTLINE
Large	Australia	Classic Cars
Medium	Austria	Motorcycles
Small	Belgium	Planes

Ans: From the above comparison we can conclude that USA has biggest deal size Ireland has lowest.

Regression and Anova:

SUMMARY OUTPUT						
<i>Regression Statistics</i>						
Multiple R	0.657840928					
R Square	0.432754687					
Adjusted R Square	0.432553607					
Standard Error	1387.45926					
Observations	2823					
ANOVA						
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>	
Regression	1	4142995200	4142995200	2152.157001	0	
Residual	2821	5430546866	1925043.199			
Total	2822	9573542065				
	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>	<i>Lower 95%</i>	<i>Upper 95%</i>
Intercept	-	1470.590019	111.4099971	13.19980305	1.20143E-38	-1689.043329
PRICE EACH	60.05936566	1.294624334	46.39134619	0	57.52085944	62.59787188

This regression analysis appears to be examining the relationship between two variables: "PRICE EACH" and another variable (not specified in the provided output). Here are the results:

1. **Regression Equation:** The regression equation can be written as: $Y = -1470.59 + 60.06X$ where:

- Y represents the dependent variable Quantity.
- X represents the independent variable "PRICE EACH".

2. **Interpretation of Coefficients:**

- The intercept coefficient (-1470.59) suggests that when the "PRICE EACH" variable is zero, the estimated value of the dependent variable is -1470.59. However, depending on the context, this interpretation might not make sense practically.
- The coefficient for "PRICE EACH" (60.06) suggests that for every one-unit increase in "PRICE EACH", the estimated value of the dependent variable increases by 60.06 units.

3. **Statistical Significance:**

- The p-value associated with the coefficient for "PRICE EACH" is 0.00, indicating that the coefficient is statistically significant at conventional levels of significance (typically $\alpha=0.05$).
- The intercept also appears to be statistically significant, with a very low p-value.

4. **Goodness of Fit:**

- The R-squared value (0.433) indicates that approximately 43.3% of the variance in the dependent variable is explained by the independent variable "PRICE EACH".
- The adjusted R-squared value (0.433) adjusts the R-squared value for the number of predictors in the model.

5. **ANOVA:** The ANOVA table indicates that the regression model as a whole is statistically significant, as the p-value associated with the F-statistic is 0.00.

6. **Standard Error:** The standard error (1387.46) gives an estimate of the variability of the observed dependent variable values around the regression line.

7. **Observations:** The analysis is based on a sample of 2823 observations.

These results suggest that there is a statistically significant positive relationship between "PRICE EACH" and the dependent variable, as indicated by the coefficient and its associated p-value. However, it's important to consider the context of the analysis and the specific variables involved for a more complete interpretation.

CORELATION:

The correlation coefficient you calculated (0.657840928) represents the strength. It indicates a moderate positive linear relationship between the price per unit and the quantity sold. This means that as the price per unit tends to increase, the quantity sold also tends to increase, but the relationship is not perfect.

Descriptive Statistics:

<u>SALES</u>	
Mean	3553.889072
Standard Error	34.66589212
Median	3184.8
Mode	3003

Range	13600.67
Minimum	482.13
Maximum	14082.8
Sum	10032628.85
Count	2823

Conclusion and Review:

In conclusion, the analysis of the provided sales dataset offers a window into the intricacies of business operations, shedding light on customer preferences, product performance, and market trends. By leveraging the insights gleaned from this dataset, businesses can make informed decisions, streamline processes, and drive growth. As the landscape of data analytics continues to evolve, harnessing the power of such datasets remains instrumental in staying competitive and responsive to the ever-changing demands of the market.
